Question 1

Question 10.3 from Wooldridge: For $T = 2$ consider the standard unobserved effects model:

$$y_{it} = \alpha + x_{it}\beta + c_i + u_{it} \tag{1}$$

Let $\hat{\beta}_{FE}$ and $\hat{\beta}_{FD}$ represent the fixed effects and first differences estimators respectively.

(a) Show that $\hat{\beta}_{FE}$ and $\hat{\beta}_{FD}$ are numerically identical. Hint: it may be easier to write $\hat{\beta}_{FE}$ as the "within estimator" rather than the fixed effects estimator.

(b) Show that the standard errors of $\hat{\beta}_{FE}$ and $\hat{\beta}_{FD}$ are numerically identical. If you wish, you may assume that x_{it} is a scalar (i.e. there is only one regressor) and ignore any degree of freedome corrections. You are not clustering the standard errors in this problem.

Question 2

Question 3
